SUMMARY

Frontend developer with **4+ years of commercial experience**. Started with outsourced Web3 interfaces, then a housing-management ecosystem, a payment gateway and an enterprise low-code platform. Specialising in **complex SPAs on React and Vue 3 with TypeScript**: I design the frontend architecture (FSD), put legacy code back in order and fix performance problems. I work with Claude Code and agentic pipelines daily.

CORE SKILLS

Frontend: TypeScript, React, React Native (Expo), Vue 3 (Composition API), Next.js, Redux Toolkit, Zustand, Pinia, TanStack Query / Table, React Hook Form

UI / Styling: Tailwind CSS, shadcn/ui, SCSS, Storybook, responsive layouts

Quality / Tooling: Vite, Zod / Yup, OpenAPI, MSW, Vitest, Jest, React Testing Library, Playwright, FSD, CI/CD, Git

Web3: ethers.js, web3.js, MetaMask, WalletConnect, smart-contract integration

AI: AI-assisted development — Claude Code, agentic pipelines, MCP

WORK EXPERIENCE

Kvant LLC — Frontend Developer (Vue) *Feb 2026 — present*

Enterprise B2B product running inside the client's perimeter, similar to Camunda Modeler: an analyst builds a BPMN diagram from blocks and the platform turns it into an executable process. Team of 6; I own the editor core — scene engine, action history, performance

- Designed **undo/redo for the whole editor — 40+ operation types**, including moving blocks between diagrams. Actions collect in a buffer and are compacted: the backend receives the result, not every mouse movement.
- Sped the editor up **from ~25 to a stable 60 FPS** on diagrams of 100+ blocks: removed the idle repaint loop, took scene geometry out from under Vue reactivity, separated measuring from painting within a frame.

Stack: *Vue 3 (Composition API), TypeScript, Pinia, Vite, WebSocket, Keycloak, Tailwind CSS, Zod, Vitest.*

Syncra — Frontend Developer (React) *Apr 2025 — Jan 2026*

Payment gateway for QR and fast-payment-system payments, about 40k payments a day: merchant portal, operator admin panel and an embeddable payment form. I worked on the merchant portal team

- Advanced the architecture along FSD: **3 applications and 50+ modules** in one codebase, with clear boundaries for every team.
- Replaced per-widget polling with a shared query cache — **30% fewer billing requests per session**, measured in gateway logs.
- Built transaction tables with live statuses over WebSocket: an update repaints one row, not the whole table — **500+ transactions update without dropped frames**.

Stack: *React, TypeScript, Redux Toolkit, TanStack Query / Table, React Hook Form, shadcn/ui, Tailwind CSS, Sentry, Vite, FSD.*

MGS LLC — Frontend Developer (React, React Native) *Mar 2024 — Apr 2025*

Housing-management ecosystem: a dashboard for management companies and a mobile app for residents instead of calls to the dispatch desk. Team of 10, Scrum, CI/CD

- **Built a mobile app from scratch** on React Native for residents and staff: requests, payments, documents, push notifications. Wrote it ahead of the backend against mocks of the OpenAPI contract — **integration took hours, not weeks**.
- Set up generation of a typed API client from the OpenAPI schema (Orval) — **manual type syncing with the backend disappeared entirely**; contract breaks show up at build time, not in production.
- Built a permission system on CASL: **a new role is one file edit**, not checks scattered across the code.

Stack: *React, React Native (Expo), TypeScript, Zustand, TanStack Query, React Hook Form + Yup, CASL, OpenAPI, Tailwind CSS / NativeWind, MSW.*

Web3 studio (outsourcing) — Frontend Developer *Jun 2022 — Feb 2024*

Studio of about 30 people building interfaces for DeFi, NFT and GameFi startups. Main project: a decentralised exchange on BNB Chain — swaps, liquidity pools, farming, portfolio

- Joined as a junior; within six months **owned exchange modules — wallets, swap, portfolio**, and by the end shipped features from mockup to production and reviewed the second frontend developer.
- Integrated **MetaMask and WalletConnect** through ethers.js: sign-in by message signature, network switching, and a transaction UI that shows both phases — signing and waiting for the block — and survives a page reload.
- Streamed prices, liquidity and yield **in real time over WebSocket**; contributed to an NFT platform (Stake / Trade / Earn) and three.js promo landing pages.

Stack: *Vue 3 (Composition API), TypeScript, Pinia / Vuex, TanStack Query, vee-validate + Yup, Vite, SCSS / Tailwind CSS, ethers.js, web3.js, MetaMask, WalletConnect, ApexCharts, GSAP, three.js.*

PRODUCT

FoodIQ — Lead Frontend *foodiq.space*

AI nutrition tracker: a meal is described in plain text, calories and macros are worked out automatically. Small team: a backend developer, an analyst and me on the whole frontend; the web app is live, the mobile app is heading for RuStore, the App Store and Google Play

- Own the entire frontend — the Next.js 16 web app and the React Native app: designed the **FSD architecture and a shared API layer** for both clients.
- Built the **AI parsing UI streamed over SSE**: items appear as they are ready, a dropped connection does not break the result, and ambiguous matches are flagged honestly rather than guessed.
- Built a **dashboard builder with 16 widgets** and drag-and-drop: the layout is stored on the server and survives older client versions.
- **Halved the entry bundle — from 2.1 MB to 1 MB** by splitting the API client and lazy-loading heavy modules.

Stack: *Next.js 16, React 19, React Native (Expo), NestJS, TypeScript, Tailwind CSS v4, shadcn/ui, TanStack Query, Zustand, React Hook Form + Zod, OpenAPI, Vitest, Playwright, Storybook, FSD.*
